Pre-Class — Session 4 (Produce With GenAI)

~30 minutes.

Do this before Session 4

1. **Finish your module folder and your Module Skeleton Map** — every file renamed to your form or deleted; the map's parts C and D done: the rung for each student piece, and the agenda sketch with first estimates. If it runs past your container, fix it on the map now. **Send the map in by the day named in class** — the maps are read before Session 4, and the session opens with what they showed.
2. **Have your Decisions doc in hand — and your course folder open in your agent tool** (VS Code with Copilot, or whichever you use). The second half of the session sets the loop up in it: the folder as context, agent mode and permissions, sub-agents, the agent file and skill files.
3. **Read the guide, Section 6 (Produce With GenAI)** — including **6e, the loop with an agent (AI-6.1 to AI-6.7)** — skim **6b (the two councils)** and **6d (pick the tool that fits)**, and read the short **Section 7 (depth)**. Section 8 you met last week; this week it gets *built* (AI-8.1 to AI-8.4).

Come ready to

- Be taught the production loop in full and see it shown — the complete version beside the practice derived from it, the six prompts, then the same loop with an agent. Bring the question half the room has: *what if the AI does not know my subject?* **You do not produce in class** — the build is this week's work, at your desk, from the loop.
- Start your **AI-direction + verification log** (the template is in your fill-in file): one row per run, chat or agent.
