

Worked Example — Intro-to-ML (Week 1)

This is the **worked example** that pairs with the how-to guide. It shows the templates *filled in* for one real course (Intro-to-ML Programming), at **surface level** — a skeleton, not a built course.

The point: someone reading the guide who gets stuck on “what does a *good* X look like?” flips here and copies the pattern.

What’s here

File / folder	What it shows	Depth
01_Decisions.md	The one-page Decisions document, filled in	Complete (it’s short by design)
02_Objectives.md	Course objectives + Week 1 module objectives	Complete
03_Sample_MDD_Week1.md	One week mapped in the MDD (the course-header block + one module table). Timing is deliberately <i>not</i> here — it lives in the teaching guide	Complete for 1 week; rest is “...”
05_Bounding_The_Answer_Space.md	A worked §6a step 5b: how to build a feedback envelope and bank for an assignment with many valid answers	Complete
Week1_folder_skeleton/	The three-package folder structure with stub files	Stubs (one-line purpose each)
Week1_folder_skeleton/Teaching_Guide/Day1/Segment1_Fully_Shown.md	One guide/Day1/Segment1_Fully_Shown.md at full depth	Complete (sets the quality bar)

How to read it

1. Start with 01_Decisions.md → 02_Objectives.md → 03_Sample_MDD_Week1.md (the planning artifacts). Then 05_Bounding_The_Answer_Space.md when you reach §6a step 5b and your assignment has no single right answer.
2. Open Week1_folder_skeleton/ to see where every file lives (stubs).
3. Open Segment1_Fully_Shown.md to see the difference between a stub and a finished artifact.

Scope warning (on purpose)

Everything except the four “complete” items above is intentionally a **stub**. This is a *surface-level recreation*, not a real course. If every stub gets filled in, the scope has been blown and a course has been quietly rebuilt. The skeleton + one fully-shown artifact is enough to communicate “done.”
